GET PERFECT WELDS

With a simple adjustment procedure that anyone can do, an AWT machine can lay down perfect welds on various circular parts.

HOW IT WORKS

Left: The fixture rotates on the turntable, while the torch stays stationary. The torch is adjustable in 5 axes. **Right:** The programable machine feeds the torch automatically. When a weld bead is finished, the torch retracts away from the part.

FEATURES

- Safety: sliding doors with interlocks and built-in welding glass separate both the operator and nearby people from the welding and the glare
- One program can do many parts. All that is required is a simple adjustment of the weld torch.
- The standard machine does parts up to 16" x 38". We can go larger with a custom machine if required.
- Runs on 240 V. If needed, we can customize a machine to run on 120V or 480V.
